Professional Summary

- Software engineer with over 5 years of professional experience.
- Over a year of experience working remotely with a distributed team.
- Was instrumental in a successful acquisition of Livingly Media.
- Regularly contributes to every part of the tech stack.
- Worked in a bootstrapped environment increasing users from 200K to 2 million.
- Leads projects for several large scale web applications.
- Persistently creates and maintains passion projects.
- Thrives on gaining knowledge and exposure to new technologies.
- Active participant in the software development community.

Skills

Proficient with the following technologies: Javascript, HTML, CSS, Git, UNIX, Python, Django, Celery, MySQL, Backbone, Underscore, CoffeeScript, and Angular, Rails, Node, PHP, and others.

Has extensive experience in the following fields: Project design, management, and development on a large scale web application, visual design mockups, usability testing, A/B testing, and quality assurance.

Experience

Software Engineer, **Livingly Media** June 2013 to Current
At Livingly, I design and build new features, systems, and architecture. As one of the engineers on a small team, I heavily influence the code base. I have been the project lead on many technologies that are being used heavily and relied upon every day by the organization.

I am often tasked as a full stack engineer doing everything from setting up a database and writing cron jobs to implementing the HTML and CSS from a mock up. Because of my unique background, I am trusted to work anywhere in the stack.

In addition to my own software, I have pioneered several new frameworks and technologies. I have been integral in every part of the process from research to implementation to documentation. I own many systems at Livingly. They will miss me

when I leave.

Web Developer, **WebStarts.com** January 2011 to May 2013

At WebStarts, I was responsible for developing new features, fixing bugs, and maintaining a large existing application. I started as a support representative in August of 2009, quickly grew to manage the support department, then moved to the development side, where I really wanted to be.

Prior to this job, I had only developed for the internet on a small scale, freelancing or working on hobbies. Working in this environment made me a very competent back and front end developer and introduced me to a wide range of new technologies and design conventions.

Customer Support Manager, **WebStarts.com** August 2009 to January 2011

Starting out as the only support representative when the company had less than 200,000 users led to training and managing a group of 10 support representatives. I was responsible for everything involving client interaction including general support, sales, client retention, billing, and developing processes and documentation for each of these areas. I was responsible for opening a Seattle office for west coast support hours. During the year and a half spent in this position, the company grew to over 1 million users.

Additional Information

I have worked on a variety of other projects that I am willing to elaborate on but the above are my most notable skills and job experiences.
