Professional Summary

- Software engineer with over 5 years of professional experience.
- Extensive experience working remotely with a distributed team.
- Elevated to a senior role at AddShoppers Inc. managing a team of engineers.
- Was instrumental in a successful acquisition of Livingly Media.
- Regularly contributes to every part of the tech stack.
- Worked in a bootstrapped environment increasing users from 200K to 2 million.
- Leads projects for several large scale web applications.
- Persistently creates and maintains passion projects.
- Thrives on gaining knowledge and exposure to new technologies.
- Active participant in the software development community.

Skills

Proficient with the following technologies: Javascript, Python, HTML, CSS, Git, UNIX, Django, Celery, SQL, React, Backbone, Angular, Rails, Node, PHP, and others.

Has extensive experience in the following fields: Project design, software architecture, cloud services, management, development on a large scale web application, visual design mockups, usability testing, A/B testing, and quality assurance.

Experience

Senior Software Engineer, **AddShoppers** Feb 2017 to Current
At AddShoppers, I joined as the technical lead for the entire organization. My first priority was to migrate all systems from a third party agency to the in house engineering team (myself and 2 greenfield developers). The second was to implement process and systems to make the engineering team productive. These 2 goals have been accomplished while new products and features have been under active development by myself.

I'm also responsible for addressing technical debt, planning future infrastructure, and scaling the team. AddShoppers is still in the growth stage so I am faced with many unique challenges each and every day.

Software Engineer, **Livingly Media** June 2013 to Feb 2017

At Livingly, I designed and built new features, systems, and architecture. As one of the engineers on a small team, I heavily influenced the code base. I was the project lead on many technologies that are being used heavily and relied upon every day by the organization.

I was often tasked as a full stack engineer doing everything from setting up databases and writing cron jobs to implementing HTML and CSS from a mock up. Because of my unique background, I was trusted to work anywhere in the stack.

In addition to my own software, I have pioneered several new frameworks and technologies. I have been integral in every part of the process from research to implementation to documentation. I owned many systems at Livingly. They miss me.

Web Developer, **WebStarts.com** January 2011 to May 2013

At WebStarts, I was responsible for developing new features, fixing bugs, and maintaining a large existing application. I started as a support representative in August of 2009, quickly grew to manage the support department, then moved to the development side, where I really wanted to be.

Prior to this job, I had only developed for the internet on a small scale, freelancing or working on hobbies. Working in this environment made me a very competent back and front end developer and introduced me to a wide range of new technologies and design conventions.

Customer Support Manager, **WebStarts.com** August 2009 to January 2011

Starting out as the only support representative when the company had less than 200,000 users led to training and managing a group of 10 support representatives. I was responsible for everything involving client interaction including general support, sales, client retention, billing, and developing processes and documentation for each of these areas. I was responsible for opening a Seattle office for west coast support hours. During the year and a half spent in this position, the company grew to over 1 million users.

Additional Information

I have worked on a variety of other projects that I am willing to elaborate on but the above are my most notable skills and job experiences.
